

# Steps:

1. Open the document attached under our Maker repo: “Code for Clarity GNG 2101”
2. For the backend of Clarity, you are going to need: app.py, utilpt2.py, and main.py, but do not use index.html yet.
  - a. To build the backend of our app, use an IDE like Pycharm to create a Python file for each of the codes within the document you just opened.
  - b. Name each file as they are labeled in the document.
  - c. Simply copy and paste the code from the document to their respective python files.
3. For the front end of Clarity, you are going to need index.html.
  - a. Create an Html file using the same IDE, Pycharm.
  - b. Again, copy and paste the code attached below index.html into the html file you made.
4. Now run the app to see if it works!
